

LEBT beam data

John Back
University of Warwick

4th June 2014, FETS Mtg

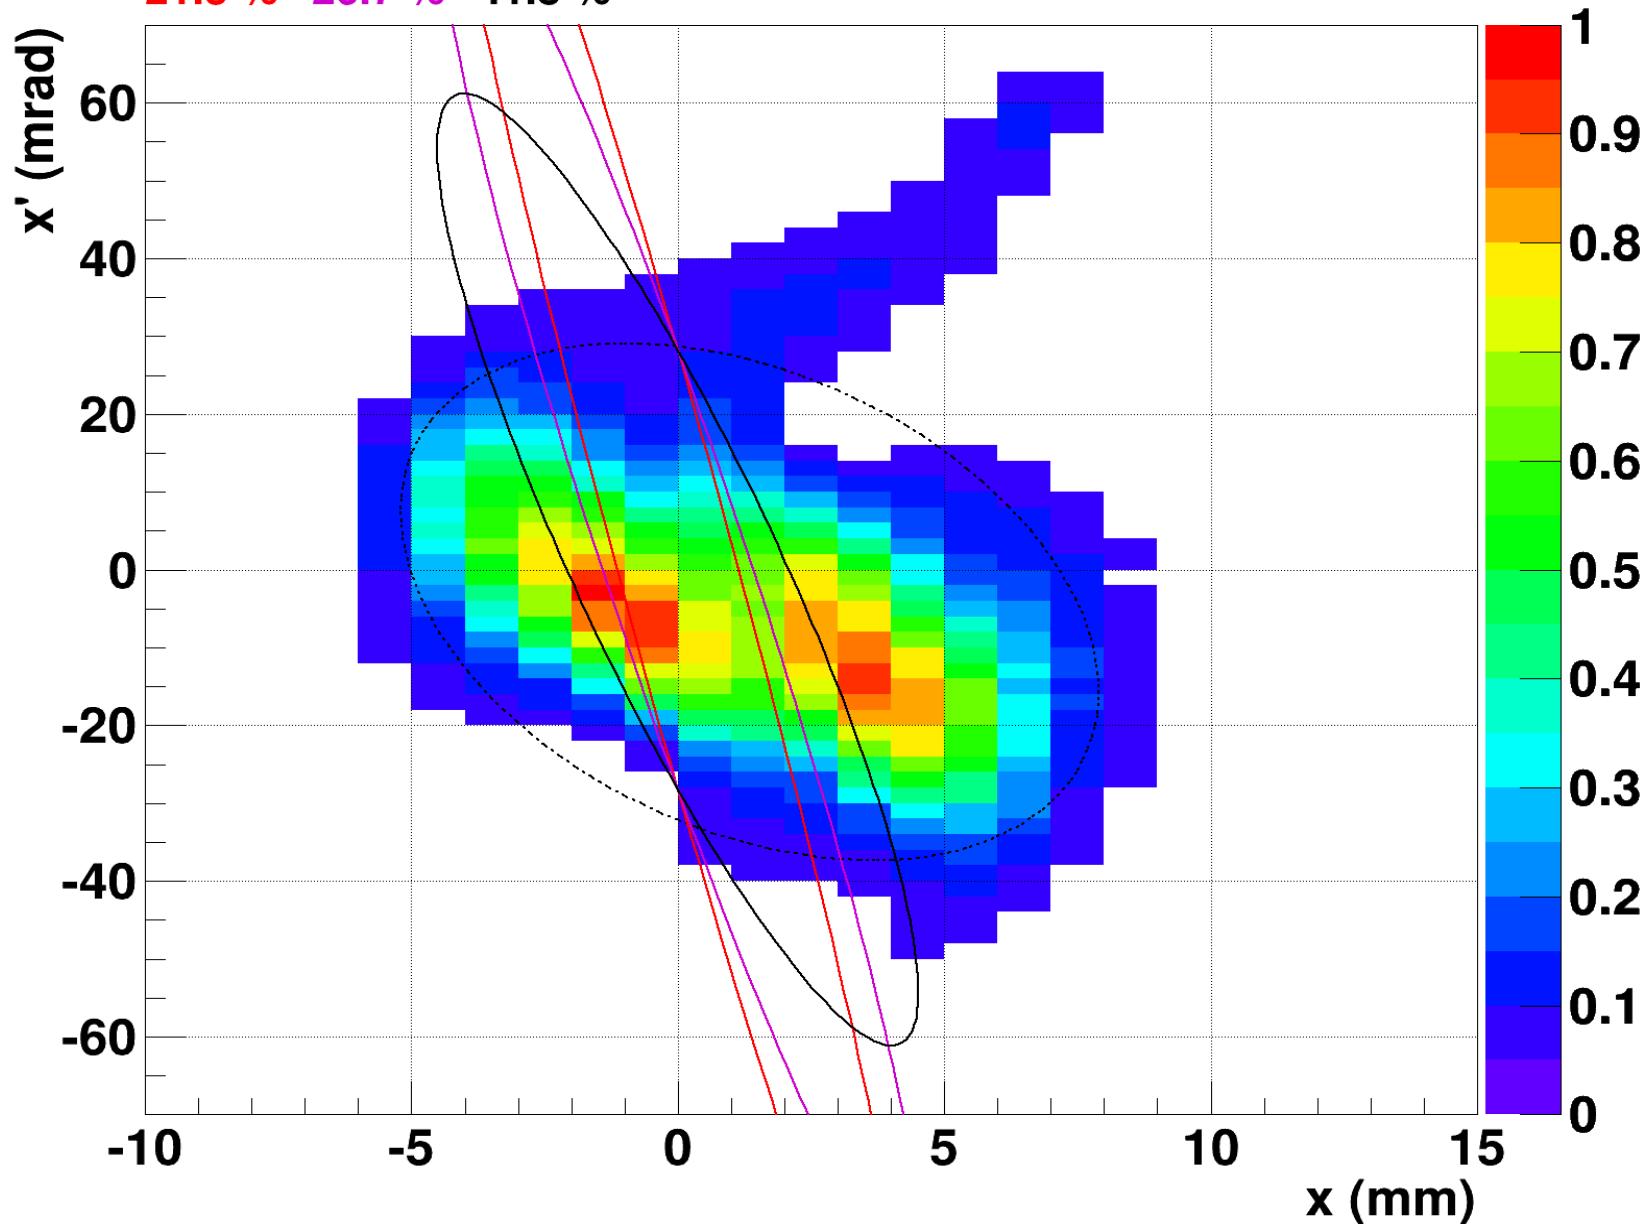

Introduction

- Plots of LEBT emittance scanner data for 65 keV beam
 - Data taking campaign over past few weeks by Christoph, Scott, Dan
- x-x' and y-y' profile scans at end of LEBT
 - Plot headings correspond to
 - Run number, Horiz then Vert scan, 3 solenoid currents (S1-S2-S3), PA settings
 - Data runs have fixed solenoid currents S1 = 130 A, S2 = 80 A
 - S3 (reversed current polarity) varied about -220 A: -140 to -245 A
 - Removed spurious “noise”; intensity threshold = 5% maximum intensity
 - Intensity weighted $\langle xx \rangle$, $\langle x x' \rangle$, $\langle x' x' \rangle \Rightarrow$ data Twiss 100% (dotted) ellipse
 - Measured rms emittance = 100% ellipse area/4
- Emittance scans compared to RFQ acceptance
 - Ideal, matched case (red ellipse)
 - Transmission ~90% case for $\gamma = 0.65 \gamma_0$ (purple ellipse)
 - Transmission ~75% case for $\gamma = 0.30 \gamma_0$ (black ellipse)
- Intensity fractions quoted within the RFQ acceptance (for the 3 cases)

200	200 – 250	250	53 – 65	20 – >22

$I_1 \gtrsim 175$ A gives over-focusing of the beam inside LEBT
 \Rightarrow high I_2 & I_3 needed to focus beam again
